Yashvi M. Patel
Age : 21 Years
Sex : Female
PID : 556

Sample Collected At:
125, Shivam Bungalow, S G Road, Mumbai

Ref. By: **Dr. Hiren Shah**

Registered on: 02:31 PM 02 Dec, 2X
Collected on: 03:11 PM 02 Dec, 2X
Reported on: 04:35 PM 02 Dec, 2X

CORTISONE

Investigation	Result		Reference Value	Unit
CORTISONE, SERUM LC-MS/MS	3.00	Low	16.62 - 74.79	nmol/L

Note:
LC-MS/MS is the gold standard for steroid hormone assays due to increased sensitivity & specificity as compared to immunoassays.

Interpretation :

CORTISONE	
AGE	REFERENCE RANGE (nmol/L)
Children	6.37 - 49.02
Adults	16.62 - 74.79

Comment :
Cortisone is one of the main hormone released by the adrenal gland in response to stress. Measurement of Cortisone is useful in diagnosing patients with low-renin hypertension caused by apparent mineralocorticoid excess. This may be due to either an inherited defect in 11HSDB2 enzyme or an acquired inhibitor of the enzyme by such compounds as glycyrrhizic acid, a component of natural licorice. Suppressed cortisone levels may also be observed in Primary adrenal insufficiency.

HEMOGLOBIN (HB)

Investigation	Result	Reference Value	Unit
Primary Sample Type :	Blood (2 ml)	**TAT**: 1 hr (Normal : 1 - 2 hrs)	
Hemoglobin (Hb) Photometry	14.5	13.5 - 17.5	g/dL

Comment :

Gender	Normal Range (g/dL)
Male	13.5 - 17.5
Female	12.0 - 15.5

Interpretation :

Hemoglobin	Interpretation
Low Levels	May indicate anemia or blood loss. Further testing may be necessary to determine the underlying cause.
High Levels	May indicate conditions such as polycythemia vera, a bone marrow disorder that causes the production of too many red blood cells.

CT ABDOMEN

Part

Abdomen : Plain & Contrast

Technique

CT scan of the abdomen has been done with administration of oral and intravenous contrast media.

Findings

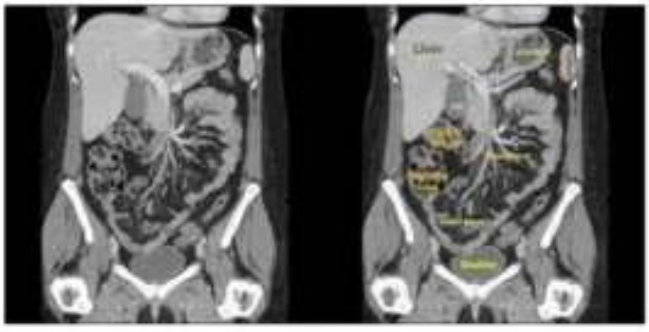

- Liver shows normal size, shape and attenuation. No mass lesion or calcification in the hepatic parenchyma. The porta hepatis is normal. No IHBR or CBD dilatation.
- Gall bladder reveals normal lumen and walls with normal size and shape. No mass lesion, calcification or stone is seen within the lumen.
- Pancreas appears normal in size and architecture. Pancreatic duct is not dilated.
- Spleen is normal in size and architecture. No focal lesion.
- Both kidneys reveal normal in size, shape, position and attenuation. No mass lesion, calcification or stone is seen in the renal parenchyma or collecting systems on both sides. No signs of obstructive uropathy are detected.
- Both adrenals are visualised normally.
- The IVC, aorta and portal vein are within normal position and calibre. No evidence of retroperitoneal lymphadenopathy or ascites.
- The visible parts of the bowel loops show no obvious mass lesions or wall thickening. Appendix appears normal.
- Urinary bladder reveals normal lumen and walls. No vesical calculi, wall thickening or mass lesion.
- Prostate appears normal. / Uterus and both ovaries appear normal. No adnexal pathology.
- Visualised osseous structures appear normal. No lytic or sclerotic bony lesion. The extra-abdominal and paraspinal soft tissues are normal.
- Lung bases are clear. No basal pleural effusion.

Impression

- **No significant abnormality is seen in present examination.**

Suggested : Clinical correlation and further evaluation, if clinically indicated.
